

STUDENT DETAILS

NAME: VALENTINE NUDI ODHIAMBO

ADMISSION NUMBER: BSCCS/2025/52984

COURSE: COMPUTER SCIENCE

UNIT CODE: BIT3208

UNIT NAME: ADVANCED WEB DESIGN AND DEVELOPMENT

LECTURER: MICHAEL NYORO

SEMESTER: 2.1

PROJECT DETAILS

PROJECT TITLE: HOSPITAL SYSTEM

SELECTED TECHNOLOGIES: **HTML, CSS, JavaScript, PHP, MySQL, XAMPP, VS Code.**

GITHUB LINK: https://github.com/Nudivalentine/BIT3208_Hospital_System_Project

Table of Contents

Week 1: Local Environment Setup.....	4
Title	4
Installation and Testing of Local Development Environment.....	4
Installation of XAMPP.....	4

Tablet view:.....	23
Mobile view.....	24

Week 1: Local Environment Setup

Title

Installation and Testing of Local Development Environment

Installation of XAMPP

Fig1 shows that the xampp setup is complete. This confirmed that I successfully downloaded and installed xampp.

Apache and MySQL Running

Fig2 shows Apache and MySQL Running successfully without any error using xampp opened as an admin

Localhost Test Page

Fig3 shows a screenshot of the localhost test page running which id proof that xampp is fully functional and ready for use.

Hello world Test

Fig4 shows the screenshot of My first php page

Database Connection Test

Fig4 shows a screenshot of a successful connection between the database and the frontend. This is after successfully connecting both the database and the frontend

Student Reflection

This task helped me understand how to set up a local development environment using XAMPP and how PHP connects to a MySQL database. I used PHP, HTML, and MySQL to test the basic functionality of the hospital system. One challenge I faced was getting the server and database to run correctly at the same time, as errors occurred when services were not started. Fig 4 demonstrates that the PHP environment is working by displaying output in the browser, while Fig 5 confirms a successful connection between PHP and MySQL using mysqli, showing that the system setup was done correctly.

Week 2: Wireframes and GUI Design

Title

User Interface Planning and System Design

Hand-drawn Wireframe

Fig1 shows a handrawn wireframe of the login and homepage layouts drawn as I was bringing the idea to life

Dashboard Layout Design

Fig 2 shows the dashboard layout of the hospital system

Mobile View Mockup

Fig 3 is a screenshot showing that the system is mobile friendly. I used the inspect feature to confirm it using different phone sizes and it is responsive in all of them

Color Theme and Structure

Fig 4 is a screenshot showing the color themes and navigation

GUI Prototype in Figma/Canva/Draw.io

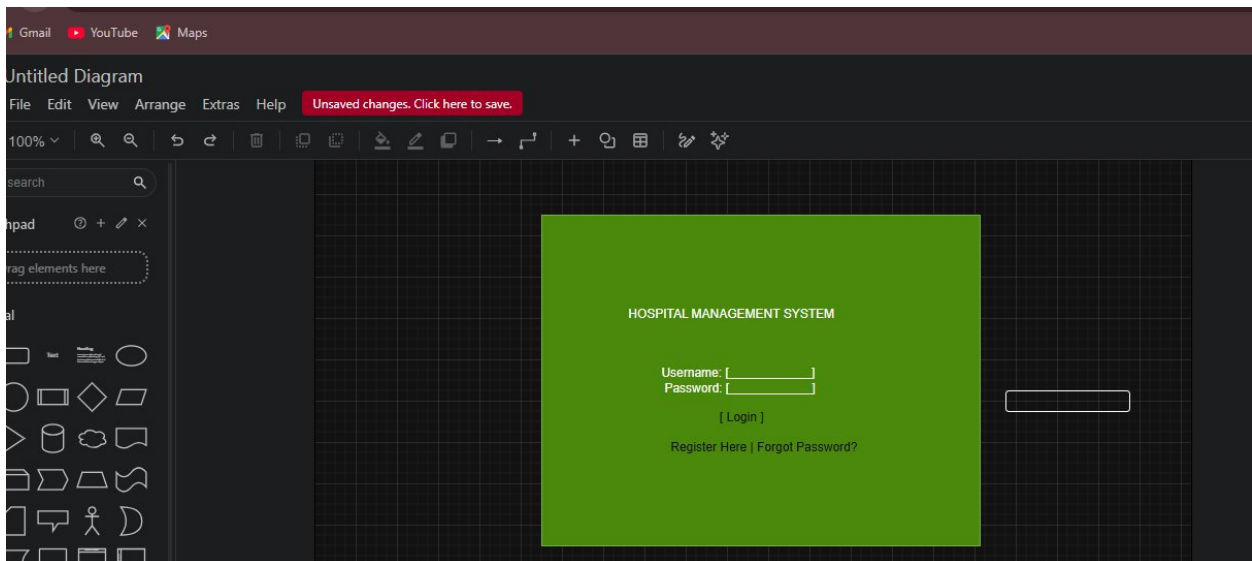

Fig5 is screenshot of the GUI prototype for the login page that I drew using draw.io

Student Reflection

This design was created to make the hospital system simple, clear, and easy to navigate for all users, including staff and administrators. The dashboard layout was selected to reduce the number of clicks needed to access key features like patient records and appointments. The navigation flow was planned in a structured manner, starting from login to the main dashboard and then to individual modules. A consistent color theme was used to improve visual clarity and maintain a professional healthcare feel. The system is mainly designed for hospital staff, receptionists, and administrators to improve efficiency and usability.

Week 3: JavaScript and PHP Basics

Title

Frontend Interaction and Backend Foundations

JavaScript Form Validation

```
File Edit Selection View Go Run Terminal Help

week5 > register.php
23 <html>
28 <body>
45 </div>
46
47 <script>
48 function checkStrength() {
49   let pass = document.getElementById("password").value;
50   let strength = document.getElementById("strength");
51
52   if (pass.length < 4) {
53     strength.innerHTML = "Weak";
54     strength.style.color = "red";
55   }
56   else if (pass.length < 8) {
57     strength.innerHTML = "Medium";
58     strength.style.color = "orange";
59   }
60   else {
61     strength.innerHTML = "Strong";
62     strength.style.color = "green";
63   }
64 }
65 </script>
66
67 </body>
68 </html>
```

Fig1 above shows the javascript form validation that takes place in the register page

Password Strength Checker

Fig2 shows the screenshot of the Registration page with the password strength checker feature

PHP Syntax Practice

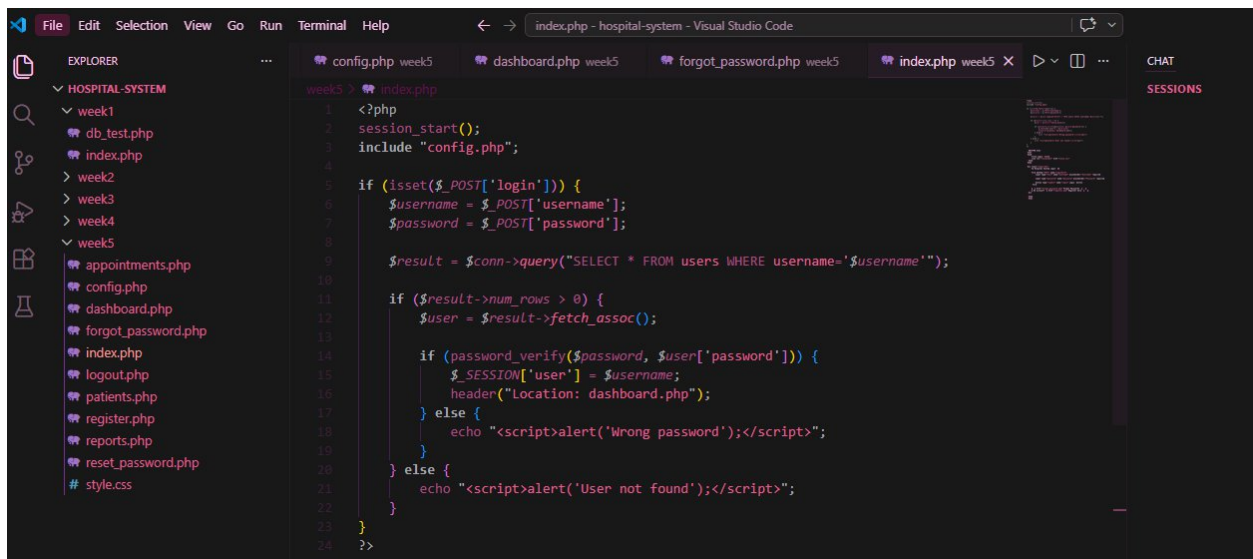

Fig3 shows the screenshot of PHP Syntax. This is a section of the index.php page

Database Connection Script

```
1 <?php
2 $host = "localhost";
3 $user = "root";
4 $pass = "";
5 $db = "hospital_db";
6
7 $conn = new mysqli($host, $user, $pass, $db);
8
9 if ($conn->connect_error) {
10     die("Connection failed: " . $conn->connect_error);
11 }
12 ?>
```

Fig4 shows the screenshot of the database connection script that enables the dynamic user input process

Dynamic User Input Handling

Add Patient

Joan Mwendwa	22	Female	0707070707	Edit Delete
Edna Gay	52	Female	0708989343	Edit Delete
Vivian Achieng	19	Female	0789898789	Edit Delete
Sam Rholex	37	Male	0701010101	Edit Delete

Fig5 shows the screenshot of the dynamic user input handling that is performed by adding data and it automatically saves or displays records because it is connected to the database part

Student Reflection

This phase helped me understand how the frontend and backend work together to process and manage user data. JavaScript validation was used to check user input before submission, improving data accuracy and user experience. PHP handled server-side processing, including form submissions, authentication, and database operations. The database connection was essential for storing and retrieving information such as users, patients, appointments, and reports. Technologies used included HTML, CSS, JavaScript, PHP, MySQL, XAMPP, and VS Code. These components worked together to create a functional and interactive hospital management system.

Week 4

Login form screenshots

Fig1 shows the screenshot of the system login form that is automatically displayed after a user registers for the first time and the rest of the login times

Form validation screenshots

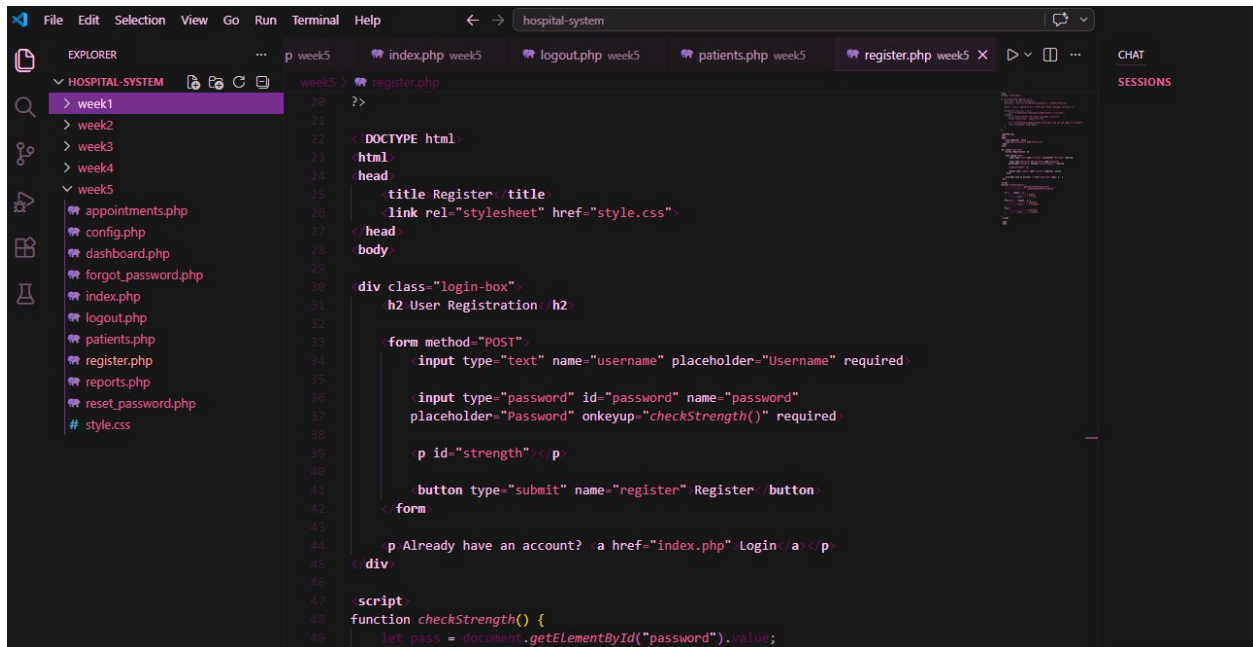

Fig2 shows the screenshot of the register form validation

PHP processing screenshots

Fig3 shows the screenshot of PHP processing in the patients.php page

Folder structure screenshots

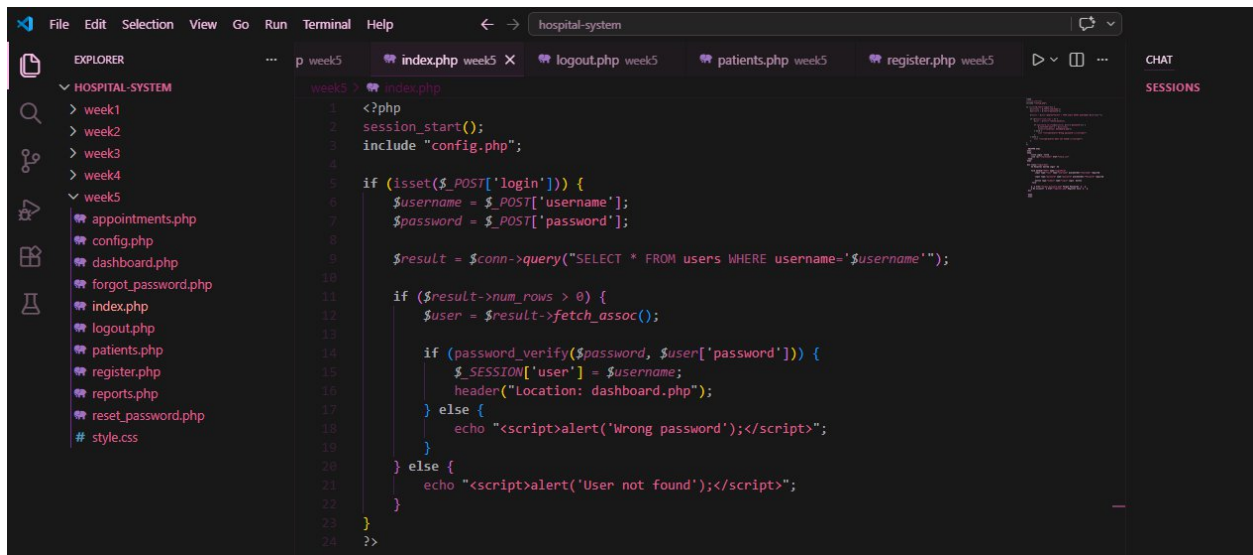

Fig4 shows the screenshot of the structures of how the folders are arranged

Database connection screenshots

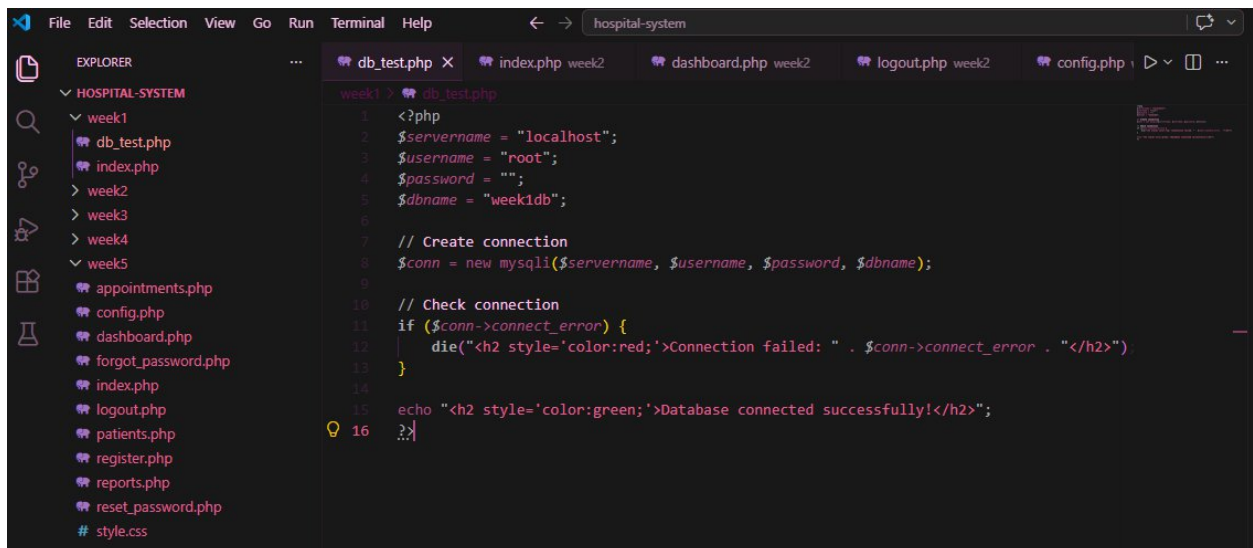

Fig.5 shows the database integration process and how it occurs in the backend side

GitHub updates

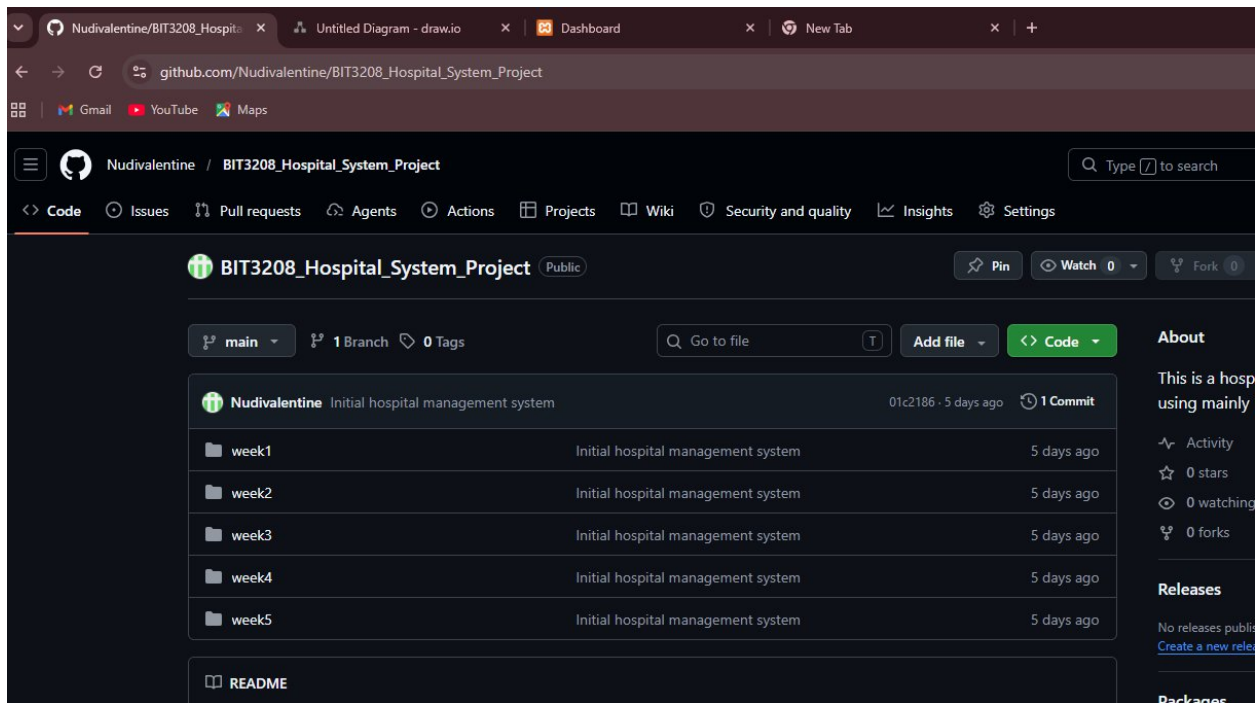

Fig6 shows the Github update process in the github page

Student Reflection

This week helped me understand what happens behind the scenes when a user logs into a system. I learned how information entered in a form is sent to the server, processed by PHP, and stored or checked against the database. The validation features helped prevent empty or incorrect input before submission. I also gained experience using sessions to keep users logged in and organizing project files into a clear folder structure. Using HTML, CSS, JavaScript, PHP, MySQL, XAMPP, and GitHub showed me how frontend and backend technologies work together in a real hospital management system.

Week 5

Database screenshots

Fig1 shows the screenshot of the database sections in the phpmyadamin

CRUD operation screenshots

Fig2 shows the operation of CRUD. The user can easily create, read update and delete

Login database integration screenshots

Fig3. Shows the login database intergration screenshot

SQL query screenshots

Fig 4. Shows the screenshot of an SQL command that enables automatic creation of reports table in MySQL

GitHub updates

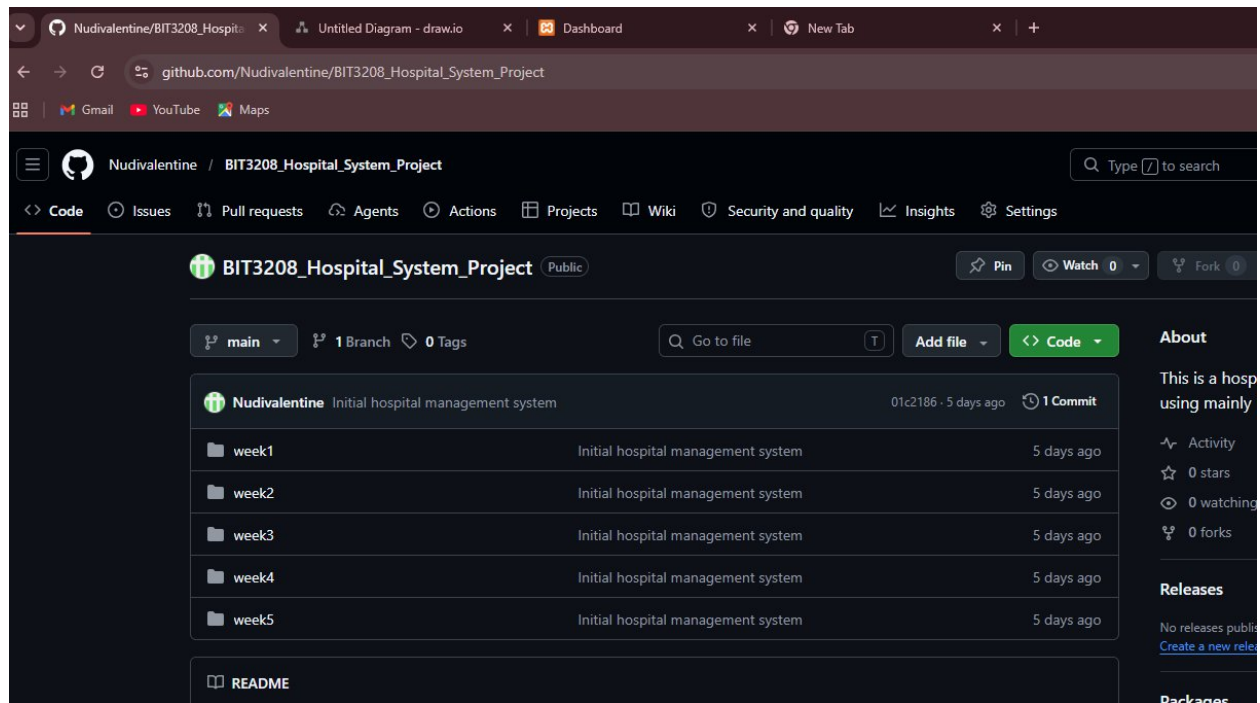

Fig5 shows the Github update process in the github page

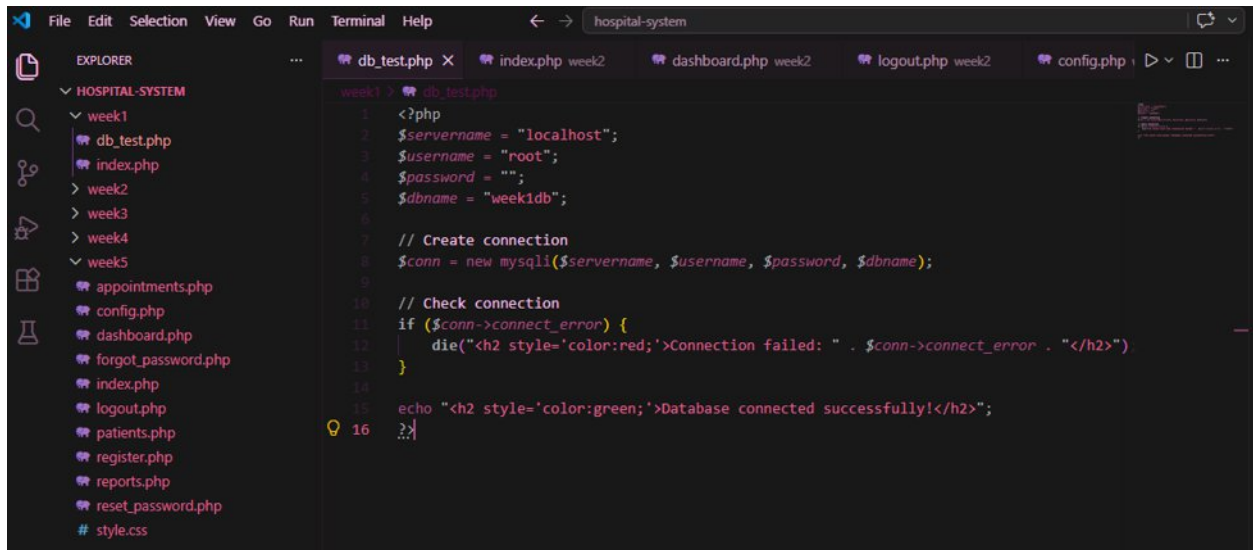

Student Reflection

This week helped me understand how databases are used to store and manage information in a real system. I learned how to create database tables and perform CRUD operations (Create, Read, Update, and Delete) using PHP and MySQL. Integrating the login system with the database showed me how user credentials can be verified securely. I also learned how to retrieve and display dynamic data such as patients, appointments, and reports instead of using static content. Through this process, I gained a better understanding of how the frontend, backend, and database work together to build a functional database-driven hospital management system.

Week 6

Database Integration and CRUD Operations

Database Intergration screenshots

```
1 <?php
2 $servername = "localhost";
3 $username = "root";
4 $password = "";
5 $dbname = "week1db";
6
7 // Create connection
8 $conn = new mysqli($servername, $username, $password, $dbname);
9
10 // Check connection
11 if ($conn->connect_error) {
12     die("<h2 style='color:red;'>Connection failed: " . $conn->connect_error . "</h2>");
13 }
14
15 echo "<h2 style='color:green;'>Database connected successfully!</h2>";
16 }
```

Fig.1 shows the database integration process and how it occurs in the backend side
CRUD operation screenshots

Vivian Achieng	19	Female	0789898789	Edit Delete

Fig2 shows the operation of CRUD. The user can easily create, read update and delete

Week 7:

User Authentication screenshots

Fig1 shows the user authentication page which asks for the username and password after a user is registered.

Password Hashing screenshots

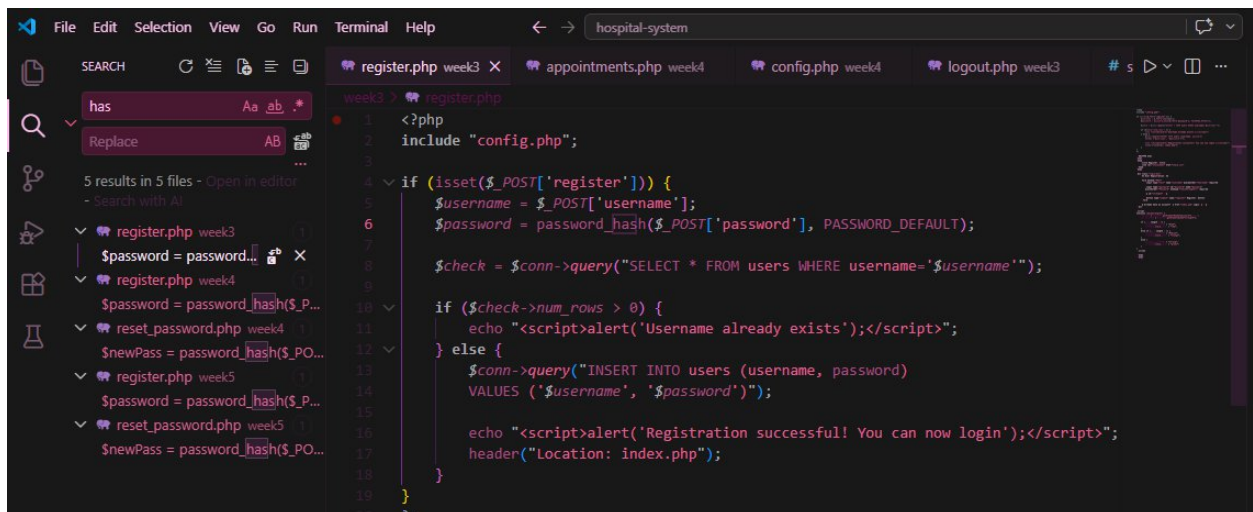

Fig.2 shows the password hashing section which converts passwords into unreadable formats before storing them in a database.

Week 8: Responsive Web Design and Mobile-First Development

Desktop view: displays multiple products per row

Fig1 shows the desktop display screenshot which proves that it can be opened on a desktop without any issues

Tablet view: displays fewer products.

Fig2 shows the tablet display screenshot which proves that it can be opened on a tablet without any issues

Mobile view: displays one product per row.

Fig3 shows the tablet display screenshot which proves that it can be opened on a tablet without any issues
